

- ◆ **Primary DSM Axis I diagnosis is from the OHP prioritized list.**
- ◆ **A DSM Axis V CGAF rating of 40 or below.**
- ◆ **Current CASII score indicates a level of acuity that requires secure inpatient psychiatric care.**
- ◆ **AND at least two of the following conditions must be met –**

related to the primary diagnosis:

- ◆ **Clinical documentation of actual imminent danger to self or others, which can reasonably be expected to improve with intensive treatment and 24 hour medical management under the direction of a child psychiatrist.**
- ◆ **Multiple placements (within the past year) in an attempt to manage symptom intensification and/or behavioral problems within either an acute care psychiatric hospital or a PRTS program.**
- ◆ **Need for intensive psychiatric review and/or adjustment of psychotropic medications evidenced by either rapid deterioration or failure to improve despite clinically appropriate treatment in a less restrictive level of care.**
- ◆ **Need for continued treatment beyond the reasonable duration of an acute care hospital and documented evidence that appropriate intensity of treatment cannot be provided in a less restrictive psychiatric program or community setting.**
